

# InfoTrack – Development Project

## Task

The CEO of InfoTrack regularly looks for new clients for the sales team to sell InfoTrack to using <https://www.solicitors.com/>. To streamline this, a developer at InfoTrack is asked to build a small app that automates the extraction of solicitors contact details by location for the CEO.

## Requirements

- Demonstrate your skills! – it is your opportunity to showcase to us your .NET web application knowledge => do this as a .NET Core Web API & SPA pair
- Conveyancing Search Submission:
  - URL: <https://www.solicitors.com/conveyancing.html>
  - Locations List: London, Birmingham, Leeds, Manchester, Sheffield, Bradford, Liverpool, Bristol
  - Contact Details: We are looking for solicitor's name, location, contact details, etc...
- Scrape the results page. Don't use 3rd party libraries, we want to see how you structure your logic
- In the UI, you need to allow user to adjust the locations list
- Come up with a standard report layout based on the data returned – use your knowhow in turning data into insight!
- If you need to use a database, please make sure to use either: SQL Express or Postgres or an in-memory database

## Tips

- Demonstrate OO Programming & clean separation of concern – It must be engineered well in a repeatable / reusable way
- If you have used JS frameworks before and want to go an extra mile in demonstrating your skills (e.g. Vue, Angular, React, TypeScript), feel free to use it in this project
- If you have some extra time, feel free to add extra features. For example:
  - History of results saved on a daily / weekly basis – can you detect and alert on new solicitors appearing in the results?
  - Scrape more data and turn into insights e.g. solicitors ranked nationally by star rating and count
  - Scrape other conveyancing listing sites
  - If you don't, it's completely fine. Better to get the basics right!
- Don't spend more than 2-3 hours on this project

## Submission / Help

Please complete the project and push your code with a readme file and send the GitHub link to: [testsubmission@infotrack.co.uk](mailto:testsubmission@infotrack.co.uk)

Before you submit, please make sure you've checked the following:

- Make sure the application can be loaded and run with minimum configuration
- We recommend cloning / downloading a new instance of your application yourself and try to run it before you submit it. Common mistakes:
  - Reference to Local files or DLLs
  - CORS not set up (.NET core application)
- Create a readme file of any steps required to run your application
- If your application uses a DB, make sure to send a SQL script containing the DB Schema creation and any initial data. Make sure to include where we can find the connection string in readme file
